The gemmological analysis of diamonds, precious stones and other minerals must be carried out by specialised gemmologists with many years' experience in this field who have taken care of the professional code of ethics governing their work as well as a thorough knowledge of crystallographic, optical and physical phenomena.

The identification of the various species and varieties of stones, the distinction between natural and synthetic stones, as well as various treatment methods currently encountered are of very important factors. More specifically for diamonds, the laws of refraction and dispersion of light, the related geometric data as well as knowledge of all aspects involved in the cutting process are essential.
